

# Umajin 3D Gesture

Powered by Intel RealSense™ Umajin applications let users control huge screens by simply pointing

## Interactive signage

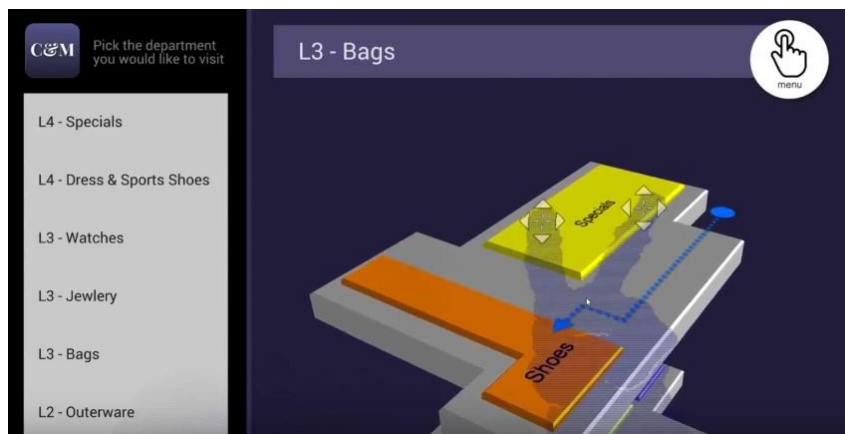

Umajin GhostHands™ user interface makes it easy for customers to interact with very large shared screens. This can turn any video wall into a shared interactive experience.

The user standing in front of the camera can see the shadow of their hand (GhostHands™) projected onto the screen allowing them to point, tap, scroll – even rotate 3D models. This works in cases where touch is impractical, even if the display is the size of a building!

Note : Umajin GhostHands™ requires an Intel core processor running Microsoft Windows

## Requires no surface cleaning

Gesture has big benefits over touch when it comes to areas where food is served or where large volumes of people need to use shared kiosks like airports or hospitals. Gesture means no touching so you don't need to have staff regularly cleaning and sterilizing screens.

## Wayfinding

Gesture kiosks for 2D or 3D wayfinding are great for large, multi-level indoor spaces. Umajin also supports hybrid apps for smartphones which can augment the kiosk and give users maps on the go.

## Events

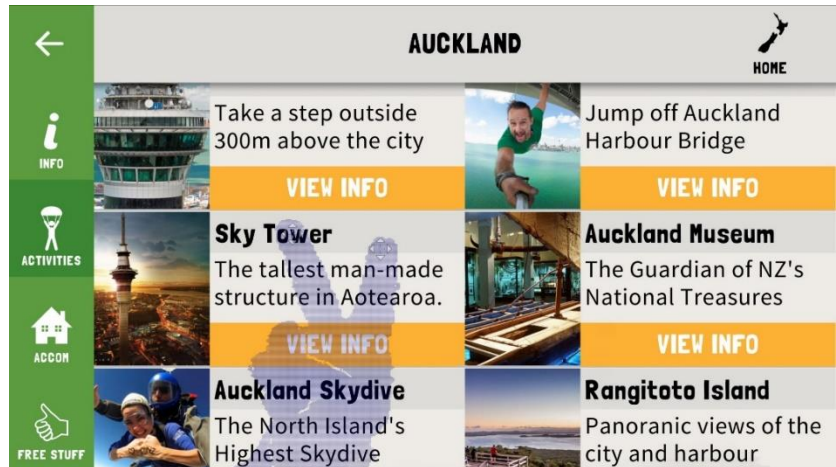

Events are a high profile opportunity to provide a large shared screen for attendees to explore the show

## Tourism

Tourism (and product information in general) allows kiosks to attract and share information with prospective customers in public locations like airports, hotels and retail spaces

## Showrooming

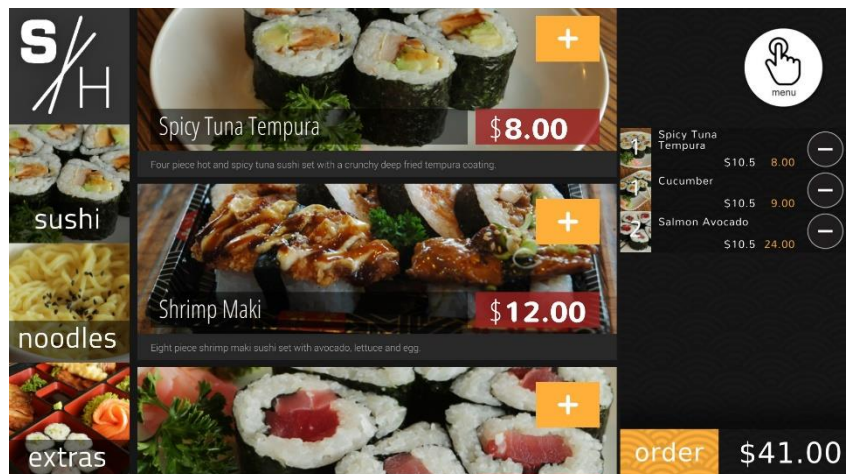

Gesture kiosks help show off virtual products on large screens. Customers can customize, explore and view and rotate 3D versions of a vehicle or building

## Menu & Catalogs

Ordering products, services and particularly food can be made more fun and hygienic using gesture
